Mini Backend mission

<u>Introduction</u>

For this part of the interview, we would like to see how you code and deliver results. So, we have prepared a small mission, taken from a real project we did. We value your time so please do not spend more than a few hours on this task. If anything on the mission is not clear, send us an email and we will get back to you as soon as possible.

<u>Mission</u>

Create a C# console application which imports the contents of the specified Excel file into an SQL Database. It should be possible to run the import more than once - the records in SQL should be updated instead of duplicated. Attached is the Excel file - "Nobel Prize Winners.xlsx". Output of the assignment is the source code of the console application.
